

## APPENDIX

**Table 1A** Words/n-grams that make up the three attitudes.

NFP	RFP	EFP
bond issuance	austerity	countercyclical fiscal policy
debt instruments	budget consolidation	discretionary fiscal policy
debt issuance	budget constraint	economic recovery
debt level	budget constraints	expansionary fiscal policy
debt levels	budget deficit	fiscal action
debt management	consolidation	fiscal expansion
debt ratio	debt burdens	fiscal expenditure
debt ratios	debt overhang	fiscal impulse
debt securities	debt problem	fiscal multiplier
fiscal and monetary policies	debt restructuring	fiscal policy stimulus
fiscal and monetary policy	debt service	fiscal spending
fiscal authorities	default	fiscal stimulus
fiscal authority	deficit	fiscal shocks
fiscal balance	fiscal adjustment	fiscal stimulus package
fiscal capacity	fiscal austerity	government action
fiscal management	fiscal balances	government consumption
fiscal drag	fiscal burden	government expenditure
fiscal framework	fiscal cliff	government expenditures
fiscal measures	fiscal compact	government guarantees
fiscal policies	fiscal conditions	government intervention
fiscal policy	fiscal consolidation	government purchases
fiscal policy and monetary policy	fiscal crisis	government spending
fiscal position	fiscal deficit	government support
fiscal positions	fiscal deficits	optimal fiscal policy
fiscal situation	fiscal devaluation	public expenditure
fiscal stance	fiscal discipline	public expenditures
fiscal variables	fiscal imbalances	public investment
government bonds	fiscal limit	public spending
	fiscal problems	public support
	fiscal restraint	stimulus package
	fiscal rules	tax cut
	fiscal soundness	tax cuts
	debt burden	
	fiscal sustainability	
	fiscal tightening	
	government debt	
	government deficit	
	national debt	
	public debt	
	sound fiscal policies	
	sovereign debt	

## Note A

We first estimated a VAR model and then carried out a Granger causality test. VAR models are classical tools for the analysis of multiple time series, given two stochastic processes  $Y_t$  and  $X_t$ , which are assumed to be jointly stationary. The joint representation of the autoregressive representation is as follows:

$$\begin{cases} Y_t = \beta_0 + A_1 Y_{t-1} + B_1 X_{t-1} + \varepsilon_{1t} \\ X_t = \gamma_0 + C_2 Y_{t-1} + D_2 X_{t-1} + \varepsilon_{2t} \end{cases}$$

where  $Y_t$  and  $X_t$  denote variables observed at time  $t$ ,  $\beta_0$  and  $\gamma_0$  are constant parameters,  $A$ ,  $B$ ,  $C$  and  $D$  are vectors of estimated coefficients. The noise terms are uncorrelated in time,  $\varepsilon_1$  and  $\varepsilon_2$  have zero means and variances  $\sigma_{\varepsilon_i}^2, i=1,2$ . The covariance between  $\varepsilon_1$  and  $\varepsilon_2$  is defined by  $\sigma_{\varepsilon_1\varepsilon_2} = \text{cov}(\varepsilon_1, \varepsilon_2)$ .
